

Performance Testing

Date	03 October 2026
Team ID	COMICCRAFT-TEAM
Project Name	ComicCrafter AI – AI-Powered Comic Strip Generator
Maximum Marks	3 Marks

Testing Scope

The supplied ComicCrafter AI project is primarily a local Streamlit application that depends on external Gemini and ClipDrop services. Testing should therefore focus on workflow correctness, response handling, six-panel validation, image completion, output generation and user-facing failures rather than claiming unverified production throughput.

Test Areas

Test Area	Scenario	Expected Result	Responsible Member
Prompt Validation	Empty story prompt	Application shows an error and does not start generation.	Nishanth S
Style Selection	Each of the four supported styles	Correct style description is passed to generation modules.	Anwin Shellman J
Panel Generation	Valid scenario	Gemini returns six parsed panel records.	Sivasankar C
Panel Count	Gemini returns fewer/more than six panels	Parser raises a clear validation error.	Sivasankar C
Image Generation	Valid six-panel data	Six image files are created when ClipDrop succeeds.	Sivasankaran M
API Failure	ClipDrop returns non-200 response	Failure is reported and incomplete output is not treated as success.	Sivasankaran M + Nishanth S
Comic Assembly	Six valid images + six texts	3×2 comic PNG is created with readable text areas.	Sivasankaran M
PDF Export	Valid final comic image	A4 PDF is generated and downloadable.	Nishanth S
End-to-End	Valid prompt through download	User can complete the full workflow without manual file operations.	All members

Performance Observation

The dominant latency is expected from the external AI services and six sequential image-generation requests. A production version should measure average panel-generation time, per-image latency, failure rate and total end-to-end generation time.
